Unit 1 – Second compulsory assignment

Based on the Hospital database project:

The data is now stored into an XML file:

1. Download the data from the text files to a XML file, with the information of the patient, and the list of their medical records with the name of the doctor, the diagnosis and a list of medications, including name and dosage.

2. Add the following options to your application:
   - Get information about the medications of a given patient
   - Get the patients that are medicated with Amoxicilina
   - Append a new medical order to a given patient
   - Delete a patient

3. Redesign the properties file to an XML format, and read it with the *loadFromXML* method.
